

MC4.07.11.24_SNaCl (MC4.07.11.24) · poly1: $B(c) = \beta_0 + \beta_1 \cdot c \cdot \beta_1 \times \sigma$ square slice (B as a function of interfacial conc.)

MC4.07.11.24_SNaCl (MC4.07.11.24) · sat: $B(c) = B_{\infty} \cdot (1 - e^{-(c/c^*)}) \cdot B_{\infty} \times \sigma$ square slice (B as a function of interfacial conc.)

1. mass
[g²]

2. ICP retentate conc.
[mM²]

3. ICP permeate conc.
[mM²]

4. conductivity-probe retentate
[μS²]

5. conductivity-probe permeate
[μS²]

6. cond.-derived retentate conc.
[mM²]

7. cond.-derived permeate conc.
[mM²]

MC4.07.11.24_SNaCl · sat
 $B(c) = B_{\infty} \cdot (1 - e^{-(c/c^*)})$

Axis: B_{∞} (y) × σ (x)
 $L_p = 11.63$ fixed
other coeffs held at the
sat fit (warm start).

▲ = per-channel optimum
-- = fitted B_{∞} value
lines = log₁₀ WSSE

Square forward-solve slice
(no per-node optimization).
Blank panels = the pinned
coefficients drive $B(c)$ out of
the physical region (no
feasible square solve there).

MC4.07.11.24_SNaCl (MC4.07.11.24) · sat: $B(c) = B_{\infty} \cdot (1 - e^{-(c/c^*)}) \cdot c^* \times \sigma$ square slice (B as a function of interfacial conc.)
